# Designing for 3D printing using TinkerCad

## Why

TinkerCAD is a great way to start making 3D models for 3D printing, or to plan out ideas that you wish to hand-cut or export for laser/CNC technologies. It's free for anyone to use, runs on any device with internet and it's arguably the most simple/easy 3D design software to start out with.

## What

TinkerCAD is made by Autodesk and works essentially like children's building blocks; you stack shapes together or cut shapes from each other to build up your part.

## How

### Getting Started

1. Go to [tinkercad.com](https://tinkercad.com) and click “start Tinkering” to get started.
  1. If you are participating in a workshop your facilitator may have you join a class.
  2. If you are working though it on your own, you will want to create a personal Autodesk account (if you don't have one already).
2. The first time you sign in the software will prompt you to complete some mini tutorials which teach you the basics of using the software. You can revisit these tutorials at any time by going to [tinkercad.com/learn](https://tinkercad.com/learn) (when you are logged in) and clicking [See all Starters].

### Increasing size of working area

You may also wish to increase the size of your space, so you can make larger objects. You can do this by using the “Edit Grid” function at the bottom right. You can set it to a maximum of 1000x1000mm (1m cube)

### Moving at smaller increments

You may also wish to change the grid snapping so you can move objects more accurately, you can do this by changing the grid snapping to 0.1mm.

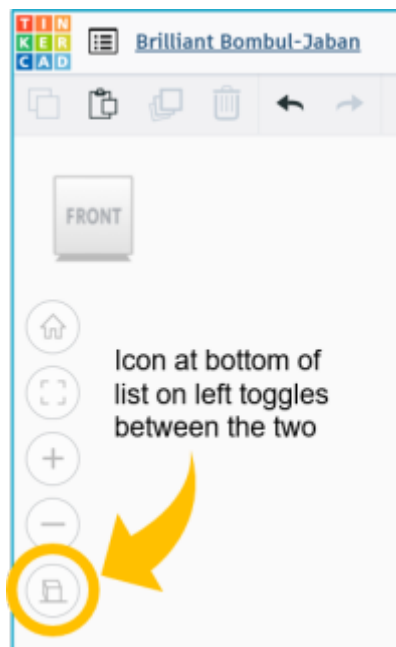

## Perspective vs Orthographic

In addition to moving around our object, we can also view it in two different modes:

- Perspective imitates looking through human eye or lense, so it's the best one when we're looking to get a feel for what our object will look like in real life, but it's quite hard to place things accurately in this mode.
- Orthographic is used traditionally for making plans and diagrams, and is usually used for Top/Side/Back views. It shows our objects nice and flat so it's easier to align objects to each other, and position them more accurately in space.

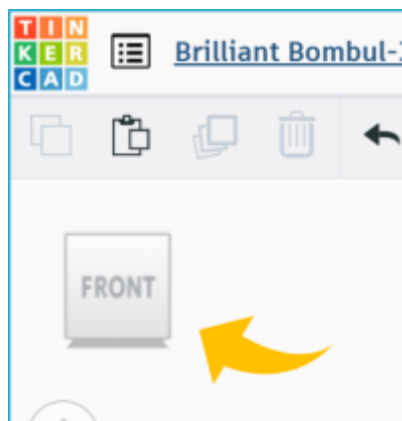

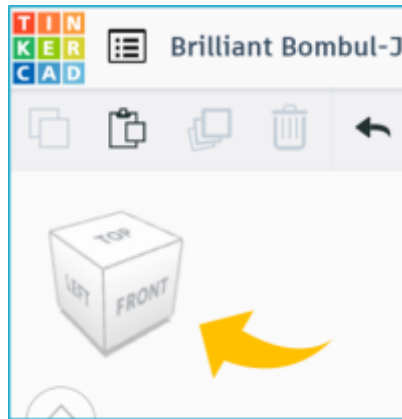

I recommend switching to Orthographic mode.

<b>Perspective</b>	<b>Orthographic</b>
Better for understanding	Better for accuracy

## Snap to a Side View

Double click on faces of cube in top right of the screen to snap exactly to Top/ Bottom/ Front/ Back/ Right Side/ Left Side

## What If/Next

### Keyboard Shortcuts

**AUTODESK®  
TINKERCAD™**

## KEYBOARD SHORTCUTS

Legend:  **Ctrl** /  **Cmd** /  **Alt** /  **Option**

### MOVING OBJECT(S)

(Using keyboard)

Move along X/Y axis	 /  /  / 
Move along Z axis	<b>Ctrl</b> -  / 
•10 Nudge along X/Y axis	<b>Shift</b> -  /  /  / 
•10 Nudge along Z axis	<b>Ctrl</b> - <b>Shift</b> -  / 

### KEYBOARD + MOUSE SHORTCUTS

(Press and hold the keys, then click and drag the mouse)

<b>Duplicate</b> dragged object(s)	<b>Alt</b> - Drag left mouse button
<b>Select</b> multiple object(s)	<b>Shift</b> - Left mouse button
45° rotation	<b>Shift</b> (Hold while rotating)
Scale in one direction	<b>Alt</b> - Hold side handle
Scale in two directions	<b>Alt</b> - Hold corner handle
Uniform scale	<b>Shift</b> - Hold corner handle
Uniform scale in all directions	<b>Alt</b> - <b>Shift</b> - Corner handle
Uniform scale in all directions	<b>Alt</b> - <b>Shift</b> - Top handle

### VIEWING DESIGNS

(With the help of a mouse or a mouse pad)

Orbit the view	Right mouse button
Orbit the view	<b>Ctrl</b> - Left mouse button
Pan the view	<b>Shift</b> - Right mouse button
Pan the view	<b>Ctrl</b> - <b>Shift</b> - Left button
Zoom the view in or out	Mouse scroll wheel
Zoom-in	
Zoom-out	
Fit selected object(s) into view	<b>F</b>

### OBJECT SETTINGS

<b>Transparency</b> toggle	<b>T</b>
Turn object(s) into <b>Holes</b>	<b>H</b>
Turn object(s) into <b>Solids</b>	<b>S</b>
<b>Lock</b> or <b>Unlock</b> object(s)	<b>Ctrl</b> - <b>L</b>
<b>Hide</b> object(s)	<b>Ctrl</b> - <b>H</b>
<b>Show all</b> hidden object(s)	<b>Ctrl</b> - <b>Shift</b> - <b>H</b>

### TOOLS AND COMMANDS

<b>Copy</b> object(s)	<b>Ctrl</b> - <b>C</b>
<b>Paste</b> object(s)	<b>Ctrl</b> - <b>V</b>
<b>Duplicate</b> object(s) in place.	<b>Ctrl</b> - <b>D</b>
<b>Delete</b> object(s)	<b>Del</b>
<b>Undo</b> action(s)	<b>Ctrl</b> - <b>Z</b>
<b>Redo</b> action(s)	<b>Ctrl</b> - <b>Y</b>
<b>Redo</b> action(s)	<b>Ctrl</b> - <b>Shift</b> - <b>Z</b>
<b>Group</b> object(s)	<b>Ctrl</b> - <b>G</b>
<b>Un-group</b> object(s)	<b>Ctrl</b> - <b>Shift</b> - <b>G</b>
<b>Align</b> object(s)	<b>L</b>
<b>Flip/Mirror</b> object(s)	<b>M</b>
<b>Select all</b> object(s)	<b>Ctrl</b> - <b>A</b>
Place a <b>Ruler</b>	<b>R</b> (  <b>start</b> toggle midpoint/center )
Place a <b>Workplane</b>	<b>W</b> ( press  <b>start</b> to flip direction )
<b>Drop</b> object(s) to workplane	<b>D</b>

 Visit [www.tinkercad.com/learn](http://www.tinkercad.com/learn) for more tips, step-by-step tutorials, and easy projects. Happy Tinkering!

## Special Techniques

### Custom Shapes

You can create simple blobby shapes using the extrusion tool:

You can also use scribble to draw pictures:

## Exporting Vector/ Line Art

If you want to use your TinkerCAD files to cut on the CNC router, Laser cutter, or Vinyl Cutter you will need a [vector](#) file. Thankfully! TinkerCAD can make one.

TinkerCAD will export all the outlines of things touching the 'floor', to get it there:

1. Rotate object so the 'detailed/engraved' face is down.
2. Copy the object
3. Click on the 'floor' (workplane)
4. Paste the object. It should snap to the floor

If you're not sure how to do any of these steps, check out the [#getting\\_started](#) section above.

Now that it's on the floor, you're ready to export!

To export the whole document:

1. Export (top right)
2. Choose .SVG

For individual or groups of pieces:

1. First selecting them in the 3D view (shift+click to add more or click and drag to select a bunch in the same area)

Then export >svg Check that it says "Include... Only the selected # shapes."
