

DIY Action Figures - Jan 2022

SLQ Wiki Fabrication Lab 2024/07/27 11:27

DIY Action Figures - Jan 2022

Acknowledgement

We acknowledge Aboriginal and Torres Strait Islander peoples and their continuing connection to land and as custodians of stories for millennia. We respectfully acknowledge the land on which we all meet today, and pay our respects to elders past, present and emerging.

Summary

Duration: 3 workshops, 4hrs each

Delivery method: face-to face

First delivered: 22 Jan, 5 Feb & 19 Feb 2022

Based on: [Diy Action Figures with Packaging from 2020](#)

Designed by: [Billie Ruben](#)

Advert Copy:

DIY Action Figures (Billie)

22 Jan, 5 Feb & 19 Feb 2022 - 13:00-17:00 Fabrication Lab

Pax: 10 / Cost: \$150

Pop! Vinyl, My Little Pony, Mighty Muggs and all the awesome anime statues you see in the stores all have one thing in common; someone designed and manufactured them.

This is your chance to make your own figurine! You will learn:

Learn to edit a 3D model template by cutting up, remixing, and sculpting using free and open-source software (Blender and Meshmixer).

Use our new 3D photogrammetry scanner to copy your real-life head onto your figure

3D Print your figure

Assemble and paint your figure

Experienced facilitators will step you through every step of the way of this workshop series, with written instructions, video demos and handouts to help you along your making journey.

This is a three-part workshop running on Saturday 22nd of January, 5th of February and 12th of February

<https://www.eventbrite.com.au/e/212189533607>

<https://www.slq.qld.gov.au/whats-on/diy-action-figures>

Skills Introduced

Workshop 1 Posing in Blender Scanning our heads	Workshop 2 Modeling in Meshmixer	Workshop 3 Preparing Models for Printing
<p>3D Printing Overview</p> <ul style="list-style-type: none"> * why print * process overview * How the printer works * Design tips <p>Blender</p> <ul style="list-style-type: none"> * Why learn Blender? * Navigation * Animation tools for posing * how to pose and save as keyframes * save project * export STL <p>Photogrammetry</p> <ul style="list-style-type: none"> * Why use it? * What is it? * How to? * What if/next? 	<p>Meshmixer</p> <ul style="list-style-type: none"> * Navigation * Make solid * Object browser * meshmixing * finding and importing models * combining models (and our head!) * sculpting * saving and exporting 	<p>Meshmixer</p> <ul style="list-style-type: none"> * Overhangs and Support * Minimum thickness * Single object * Manifold * Cutting model up <p>PrusaSlicer</p> <ul style="list-style-type: none"> * Slicing overview * Slicing tips * Checking a slice

Materials

If your workshop does not require any materials (maybe digital only) delete this section or change to something more appropriate.

Material	Quantity	Cost	Supplier
PLA Filament	approx 50g / participant	TBA	TBA

Tools and Preparation

Facilitation Tools

- Zoom license
- 3D printer/s
- Webcam
- Headset with microphone
- OBS Studio + VirtuCam2 Plugin (optional)
- ChromaCam (optional)
- Laser Cutter
- 2D Priter

Software & Files

Software/ File	Download Link
All files/ Software at time of first delivery	Dropbox Link
Autodesk Meshmixer	http://www.meshmixer.com/download.html
Blender	https://www.blender.org/download/
Inkscape	https://inkscape.org/release/inkscape-1.0/
PrusaSlicer	https://www.prusa3d.com/prusaslicer/
3D Model Templates	3D Models
Packaging Templates	Packaging Templates

Preparation

1. Advertise and enroll participants
2. Send them USB stick of all files/software (optional)
3. Send them an email telling them to either download the files and software from dropbox and install or from USB Stick, have a mouse and second monitor (optional) ready, and give them zoom link to meeting.
4. Set up and test Zoom.
5. You can also use OBS to switch easily between various screens and super-impose yourself in front of the content (using ChromaCam), then stream it as a camera to zoom using the VirtuCam2 Plugin for OBS

Workshop Walk through

Workshop 1: Posing in Blender

Below you will find the relevant videos and slides for workshop 1, along with relevant notes/transcripts

Videos

Video	Script

<p>blender_navigation.mp4</p>	<p>Moving your view around your model is really important so that you can see all the different areas of it. To do that in any 3D program you really need a mouse (a laptop trackpad just doesn't give you enough functionality). In Blender; * You can zoom in and out with your scroll wheel * You can orbit around your model by holding down on the middle mouse (that's clicking down on your scroll wheel) and then moving your mouse around * And you can pan by holding the shift key and your middle mouse down, and then moving your mouse. * You can also snap to view a certain side of your model by holding down the alt key, your middle mouse button and moving your mouse. So in blender the key to moving around is really that middle mouse button. It's really easy in 3D spaces to be working on something from one angle and think it looks totally fine, only to move to a different angle and realise it's actually totally wrong So, it's a really good idea to constantly zoom out, and move around your object, just to check it's all hunky-dory</p>
<p>blender_posing.mp4</p>	<p>We can change the posture of a rigged model without needing to re-sculpt it, by moving its armature which essentially act like the character's skeleton. To start, open your rigged file by going File-Import-FBX Then, jump into the animation tab In the dope sheet, move the slider to 10sec In the 3d viewport click the Show Xray Icon so we can see our armature Click on one of the bones of the armature and switch to pose mode From here we can: * Rotate a bone by hitting R on our keyboard * Or Translate it by hitting G (this is like moving it) * Or Scale it using S (this makes it bigger or smaller) It's easy to get a bit lost when doing this, so it's good to make these changes while in orthographic mode, looking side-on at your model, and to move around your model often so you can check that it's all as you want it. Once you are happy with the way your model looks, you can store this position as a keyframe by selecting all the bones (by clicking and dragging) then hitting I on your keyboard then LocRotScale, this saves the exact positions of the bones at the current time. You can also add other positions to this same file by simply moving the timeline along a bit on the dope sheet, and re-positioning the model. This forms the basis of animation in Blender. If you want to revisit an old position select all the bones and move to the keyframe you wish, then edit the bones as normal.</p>

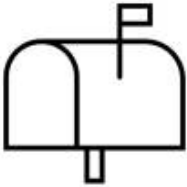

<p>blender_save_and_export_-complete.mp4</p>	<p>Once you have edited your model, it's often handy to be able to come back and edit it later on, or to be able to take it out of Blender so you can use it in a different program.</p> <p>To do these things we use the Save and Export functions. To use your model in another program, head to object mode and select the models, then go file>export. You will see a few different options of file types, what you pick will depend on what you're doing; for 3D prints, save it as an STL; for videogames, use OBJ; and for rigged files that you want to animate, use FBX.</p> <p>To save the whole project file so you can come back and edit it later, use File>Save As (remember that any animation poses won't save unless you've added them as keyframes to the Dope Sheet)</p> <p>Like with any file, it's a good idea to save your progress regularly, and to save versions before major changes so that you can always go back and revisit your project.</p>

<p>Checklist</p> <ul style="list-style-type: none"> <input type="checkbox"/> How to use Zoom -mute/unmute <input type="checkbox"/> Everyone installed all the programs (particularly Blender today) <input type="checkbox"/> Everyone un-zipped all the files and saved them somewhere handy? <input type="checkbox"/> Got a mouse? <input type="checkbox"/> Got a second screen? 	
<p>Hi! I'm Billie!</p> <ul style="list-style-type: none"> • Runs many 3D printing communities • Makes handy guides/tutorials • Loves The Edge 	<p>We will be hanging out for a few weeks while we learn together, so it will help if we know a bit about each other. I also want to make sure I'm giving you what you came here for.</p>
<p>Getting to know you</p> <ul style="list-style-type: none"> • What we should call you? • Have you been to the Fabrication Lab before? • What is your previous experience with making 3D models and 3D printing? • Why did you sign up? What do you hope to get out of these sessions? • Are you on Mac or PC? 	
<p>This workshop series</p> <ul style="list-style-type: none"> • Today: <ul style="list-style-type: none"> • Overview of 3D Printing • Posing our Action Figure in Blender • Next Week: Sculpting in Meshmixer • Week 3: Preparing our models for printing and Slicing them in PrusaSlicer • Week 4: Post-Processing and Packaging in Inkscape 	

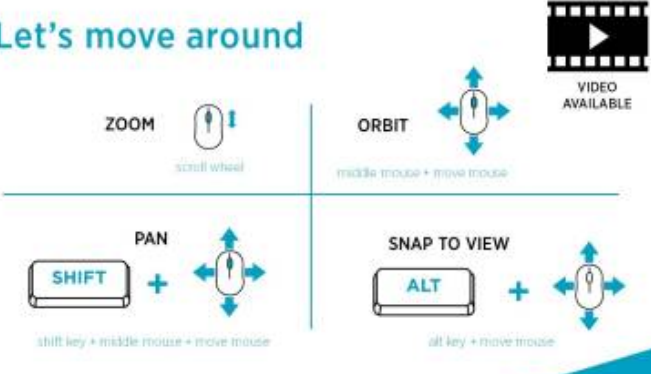

Slide	Notes
<p>How this session will work</p> <ul style="list-style-type: none">• This webinar + recording (let me know if you have any issues with a recording being shared!)• Accompanying videos (icons on slides) • Wiki: https://wiki.edgeqld.org.au/doku.php?id=workshops:prototypes:diy_action_figure <p>We're new to this online format, so please give us lots of feedback, it will help us make these sessions better for future. 😊</p>	<p>We will be sending you your 3d prints, and your packaging. Is your address that you signed up with still valid?</p>

Slide	Notes
<p data-bbox="165 853 371 891">Expect Mail!</p> 	<p data-bbox="855 176 1070 208">Custom Objects</p> <ul data-bbox="855 210 1458 432" style="list-style-type: none"> * Like the action figures in this workshops * Functional things in specific use cases, like little hooks that fit onto your exact picture rails, or a tool (e.g. sewing seam allowance, stencils) * Personalised gifts etc * Tabletop gaming (like dungeons and dragons, custom characters & scenery) <p data-bbox="855 465 1007 497">Short Runs</p> <ul data-bbox="855 499 1474 622" style="list-style-type: none"> * Because it's not quicker than traditional methods like injection moulding, * but there's also no set up cost to run a new design. <p data-bbox="855 656 1382 719">Prototyping, Iterating, human-centred design</p> <ul data-bbox="855 721 1453 815" style="list-style-type: none"> * Print something, test it, change it, print again. * Get to properly try things before buying 10,000 and realising no one wants this object. <p data-bbox="855 848 1074 880">Rapid Response</p> <ul data-bbox="855 882 1442 1037" style="list-style-type: none"> * E.G COVID19 PPE shortage: able to make face shields despite supply chains broken/behind because all we needed was filament, no need to set up injection moulding and such which takes several weeks. <p data-bbox="855 1070 1096 1102">Remote Solutions</p> <ul data-bbox="855 1104 1477 1391" style="list-style-type: none"> * Can send file near instantly, and print and use an object, no shipping time/wait * E.g car part, instead of being imported gets printed when you need one (no waste, no weeks of wait) * Or space, no need to hobble together solutions, NASA has printer on International Space Station, all they need its it and plastic and they can make many parts and different solutions. <p data-bbox="855 1424 1054 1456">Manufacturing</p> <ul data-bbox="855 1458 1469 1865" style="list-style-type: none"> * Distributed manufacturing, fewer big industrial factories, people can buy or make models and print at home * Demand-driven just print what's needed and not more. No manufacturing, shipping holding warehouses of parts/items that may not be sold –eliminates that cost as you can just print as objects are requested * Lessens environmental impact of industrial manufacture, shipping and storing. We also use a material called PLA which is made from renewable resource (mostly corn) and recyclable –same stuff Woodford folk festival use on their food containers

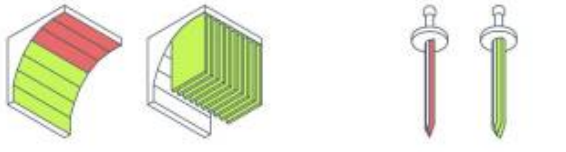

Slide	Notes
<h3 data-bbox="165 210 408 248">Why 3D Print?</h3> <div data-bbox="229 271 766 544">  <p>Custom objects Short runs Prototyping, iterating</p> <p>Rapid Response Remote Solutions Distributed, demand-driven, responsible manufacturing</p> </div>	<p data-bbox="855 286 1430 349">Digital 3D object into physical one, like a paper printer turns 2D digital into physical.</p> <p data-bbox="855 383 1453 477">3D Printing aka Additive Manufacturing = Adding material to object as opposed to subtractive like CNC router, laser cutter, lathe</p>
<h3 data-bbox="165 624 496 663">What is 3D Printing</h3> <div data-bbox="185 734 794 887">  <p>Digital 3D object into physical one</p> <p>3D Printing aka Additive Manufacturing (VS Subtractive -like CNC Routers)</p> </div>	<p data-bbox="855 636 1469 698">Many different 3D printing technologies, easiest to start FDM/FFF due to price, safety</p> <p data-bbox="855 732 1382 795">Fused Deposition Modeling (FDM), or Fused Filament Fabrication (FFF)</p> <p data-bbox="855 797 1466 954">* FDM/ FFF is essentially: * A hot glue gun that moves around, * building the shape layer by layer, on top of itself * instead of glue sticks uses plastic string called filament</p>
<h3 data-bbox="165 1041 320 1079">FDM/FFF</h3> <ul data-bbox="165 1128 488 1256" style="list-style-type: none"> • Easiest to start with FDM/FFF • FDM/ FFF = Hot glue gun that moves around, building the shape layer by layer 	
<p data-bbox="316 1543 635 1601">Where have you seen/heard of 3D Printing being used?</p> <p data-bbox="277 1630 671 1659">What would you 3D print if you could?</p>	<p data-bbox="855 1451 1414 1514">Model -Download (from many sites online) or make one (like we are!)</p> <p data-bbox="855 1516 1422 1545">Slice -Turns model into instructions for printer</p> <p data-bbox="855 1547 1469 1704">Print -Using machine (and troubleshoot!) -It's still hard bringing digital into real, like 2D paper printers still jam all the time, and 3D printers just add more complexity. So there is an element of troubleshooting.</p> <p data-bbox="855 1706 1453 1800">Post-Process -Remove supports, sand and paint (if you want to!, I quite like the look of raw. You can also do fun things like add gold leaf)</p>

Slide	Notes
<p>How does it work?</p> <ul style="list-style-type: none"> • Model –Download or make one (like we are!) • Slice -Turns model into instructions for printer • Print –Using machine (and troubleshoot!) • Post-Process -Remove supports, sand and paint 	<p>Slicer software takes 3d model Cuts it up into thin layers like hundreds of cross sections Then draws out the picture of each cross section in lines These lines get turned into coordinates that the printer moves to and squeezes out plastic between. Prints layer by layer, from bottom to top, each layer is like a big linework picture, stacked on top of the previous So the printer doesn't "know" what it's printing. It just has a list of numbers, essentially. Builds upon itself. Can't start mid air</p>
<p>From Model to 3D Printer</p> 	<p>So, because it builds from the bottom up, on top of itself this means it can't print things in mid air, it needs material underneath. This applies too, to steep overhangs: ones that stick out more than 45 degrees. We can add support material, but it can make parts look not as pretty because there's a careful balance between having enough material for the part to build on, while also being able to remove it... Thankfully we can design away a lot of the need for them in the design stage...</p>
<p>Design Tip: Overhang and Support</p> 	<p>Here are some examples. The red areas would need support, because they either start over nothing or have steep overhangs. But we could fix some of these! We could attach the giraffes tail to it's back leg, so it was resting on the body, and we could have its head and ears facing up. Its belly is a bit unavoidable, unless we cut the model into two, horizontally and print both halves then glue them back together later. On the woman the arms head and hem of the skirt all start over nothing, so we would need to add support in the slicer. Similar with the jumping person, on their head, leg, arm and stars. Interestingly the super hero is pretty good though, all these angles are about 45 degrees. The hand on the folded arm seems to be resting on the hip, so it doesn't need support, both feet start on the ground, and it looks like that cape either starts at the floor or the leg, though it could be a little thin...</p>

Slide	Notes
<p>Examples</p> 	<p>Because we are squeezing out a line of plastic that isn't infinitely thin, some detail won't be possible, so it's important to keep all parts a bit chunky. Thin bits either wont print, or will break off later.</p>
<p>Design Tip: Minimum Thickness</p> 	<p>I've also made a poster with more tips, mostly tailored at less organic shapes/ more functional ones, but they still hold true. Full-res version here: https://imgur.com/gallery/SqldFwB</p>
<p>More Tips</p> <p>Can be found on this poster I made: https://imgur.com/gallery/SqldFwB</p> 	
<p>Why blender?</p> <ul style="list-style-type: none"> • Can do almost anything in 3D pipeline. • One of the only free/good animation/posing software • Note: 2.8 is very different (lots better) than previous versions. 	<p>Can do almost anything in 3D pipeline: modeling, rigging, animation, simulation, image editing, rendering, scripting, compositing, motion tracking, video editing and game creation. One of the only free/good animation/posing software Note: 2.8 is very different (lots better) than previous versions, especially in the user interface and learnability, so if you've tried it before and hated it (like me!) it's worth trying again now. :)</p>

Slide	Notes
<p>Let's get started!</p> <ul style="list-style-type: none"> • Open Blender • Click on main screen to close popup • Click on cube and [delete] with your keyboard • File>import>FBX find your model (male or female) 	
<p>Let's move around</p> 	<p>Armature is like a skeleton, its bones are like our bones, we can move them to change the shape of the model.</p>
<p>Posing our model</p> <ul style="list-style-type: none"> • Armature is like skeleton • Armature = invisible/not part of our model 	<p>Animation tab: posing is usually used in animation, so we will be using a lot of animation tools in Blender Dope sheet move slider to 10 sec: dope sheet is where we would normally set keyframes which is like the main positions in an animation. We're using the sheet here just to save our poses (if we don't, they disappear when we go to save it) 3D Viewport> Show x-ray Click bones> pose mode</p>
<p>Posing our model</p> <ul style="list-style-type: none"> • Animation tab • Dope sheet move slider to 10 sec • 3D Viewport> Show x-ray • Click bones> pose mode 	

Slide	Notes

Workshop 2: Modeling in Meshmixer

Below you will find the relevant videos and slides for workshop 2, along with relevant

notes/transcripts

Videos

Video	Script
<p>meshmixer_gettingstarted.mp4</p>	<p>In Meshmixer, you can start a new file in various different ways, depending on what you're doing.</p> <ul style="list-style-type: none"> * If you're starting a new sculpture totally from scratch, you might want to start with a sphere, it will be sort of your lump of clay at the beginning. * If you are opening a file you've previously worked on in Meshmixer you will want to use the open function, and find your file. * Similarly, if you want to edit a model that you already have (say you downloaded one from the internet), you can use the import function, which will bring your model in and start a new Meshmixer file. * For now I'm going to Import this bunny model, so I can show you around. <p>So once you are in Meshmixer, you will see your object. And you can move around this 3d space in various ways.</p> <ul style="list-style-type: none"> * You can Pan across the current plane by clicking and holding down your central mouse button, (that's the scroll wheel on your mouse), and moving your mouse it around. * You can Orbit or Tumble around your model by holding down right mouse button and moving your mouse around. <p>And you can Zoom in and out with your mouse wheel or by pressing ALT, holding down the right mouse button and moving your mouse.</p> <ul style="list-style-type: none"> * When you get lost, like say you end up way inside here and you're like "Where am i?" you can click on View-Recenter View and it will snap you back out, so you can see your full model again. * It's also good to take note of the cube up in the top right corner, as it will give you an indication of what part of your model you are looking at. <p>If you forget any of these there is a Keyboard shortcut document when you first start up mesh mixer, that has all of these listed (and more!)</p>

Video	Script
<p>meshmixer_fixingholes.mp4</p>	<p>Holes, such as this one at the bottom of this Stanford bunny are not ideal, because when we to generate the 3D printing file the slicing software can't tell what's inside the model and what's outside, and this can create some pretty severe errors</p> <p>To prevent this we use the made solid function, which fills these holes and sorts out any weird bits of geometry for us</p> <p>Click on the object to select it Edit>make solid From this menu we can change the mesh density, which allows us to preserve or remove detail, so if I bring this right down and hit update, it will make a very choppy bunny, and if I bring it back up, make it smoother, like my original, So it's a good one to play with that one, just to ensure you're not losing any detail when you go through this function. Once you're happy with it, hit accept, and it will show that it has filled in the bottom. You'll end up with 2 separate objects in your objects browser, one that says solid and one that doesn't say solid So if you want to you can now delete this old one so you're just keeping the solid one</p> <p>You can use the make solid function to repair things like 3d scans, and objects you download from online. This is especially handy if the objects were not originally made for printing, like, for instance they were made for a videogame. It's also good practice to do it regularly to any file you've</p>

Video	Script
meshmixer_hideanddeleteobjects.mp4	<p>If you have a bunch of objects in your scene it can get a bit cluttered, and this can make it really hard to edit a single model.</p> <p>Thankfully, we can make certain objects invisible through the object browser</p> <p>To do so, go View> show objects browser.</p> <p>From here we can select objects by clicking on them in this menu. Notice how the selected object is lighter in the scene and darker in the menu, when selected.</p> <p>We can use these eye symbols next to the objects to toggle their visibility.</p> <p>You'll notice that when I toggle the object that I also have selected, in this case the bunny, you get this x-ray effect. To stop seeing this you can click another object.</p> <p>You also might want to entirely remove an object from your scene, so that you can no longer make it visible again, and its no longer part of your file.</p> <p>To do this, select the object and hit the garbage can icon in the bottom right to delete it.</p> <p>You'll notice it has disappeared from the browser and our scene.</p>

Video	Script
<p>meshmixer_addmoveandjoinobjects.mp4</p>	<p>To join 2 objects together you first have to add them to your scene, then resize and move them into place, and finally, combine them.</p> <p>To get started, click the import button, then append. Then double click the object you want and it will be added to your scene.</p> <p>To move it into place, first click on it to select it (it will turn light grey), then go Edit>transform.</p> <p>From here we can:</p> <ul style="list-style-type: none"> * Move the object by clicking and dragging the directional arrows * We can rotate it clicking and dragging these arcs * and we can make the whole object bigger or smaller by clicking the centre cube and dragging our mouse left or right. <p>As with all edits in 3d space, it's good to look around your model often to check everything is where you want it. Once you're happy with it, hit 'Accept'.</p> <p>Now, to join these models together into one form, start with one of them selected then hold down shift on your keyboard and click the other, so that you now have both selected in light grey, then click Boolean union, wait for it to process, then click accept.</p> <p>You will see they're now the same object in the object browser.</p> <p>If you're combining a model for 3D printing, it's a good idea to check that things like hats are already filled in on the inside, as this can lead to complications when you go to print it. For instance it would have been good to fill this hat with a cone shape, and combining those with a Boolean union first, before joining it to our figure, to eliminate this hole in the centre.</p>

Video	Script
<p>meshmixer_sculptingindigitalclay.mp4</p>	<p>There are lots of models online, but sometimes we want to make our own, or to make changes to models that we find.</p> <p>We can make some of these changes in Meshmixer using the Sculpt tools.</p> <p>This allows us to edit our models as though they were made out of a digital form of clay.</p> <p>Click on the object you wish to edit, and then click sculpt. From here we can access the brushes menu, which gives us an array of tools to try.</p> <p>Each brush is used by clicking and dragging on the model to 'paint' with that effect.</p> <p>The Draw tools add bulk to the areas they're used. You can make a brush bigger or smaller using the size slider.</p> <p>The Drag tool allows you to grab and pull an area of the model.</p> <p>The Pinch tool makes little peaks along your model. And the Robust Smooth tool allows you to even out areas.</p> <p>There are a few more types of brushes, so feel free to have a play with those, as well as the sliders under properties, to change different features of the brushes.</p> <p>It's easy when using the sculpt tools to introduce strange geometry, so it's good to use the make solid function every now and then, because it fixes any weird bits.</p> <p>You also don't need to start with an existing model, you can use a simple sphere to begin with, and build a model totally from scratch using these sculpting tools.</p> <p>Sculpting is also just one way to edit a model. For less organic, more structured items like say a building, or a table, you might like to use something like TinkerCAD instead of Meshmixer.</p> <p>For real-life functional items, with strict dimensions and parameters, for example something like a tool, you might want to try some proper CAD software like Fusion 360.</p>

Video	Script
<p>meshmixer_saveforeditand3dprinting.mp4</p>	<p>Once you have edited your model, it's often handy to be able to come back and edit it, again, later on, or to be able to take it out of Meshmixer so you can use it in a different program, for example your slicing software for 3D printing.</p> <p>To do these things we use the Save and Export functions.</p> <p>To use your model in another program, click on the object you want and go file>export. For 3D prints, save it as an STL ASCII Format. Give it a name and hit save. This process will only export the selected model, so if you want to export more than one, it's recommended you combine them first using the Boolean Union.</p> <p>To save the whole project file so you can come back and edit it later, use File>Save As</p> <p>Like with any file, it's a good idea to save your progress regularly, and to save versions before you make major changes so that you can always go back and revisit it.</p>

meshmixer_cutanobjectoutofanother.mp4	<p>Sometimes you might want to cut one object out of another, for example to make a simple base stand for a model.</p> <p>Here we have our model, and her feet are placed just a little way into this cylinder. It's easiest to see when the cylinder is in x-ray view.</p> <p>I want to cut the feet shape out of the cylinder, so I've placed them overlapping each-other. To make the cut first select the object you want to cut from, then hold shift and click the object you want to cut out of that first shape. Then select Boolean difference, and hit accept.</p> <p>And there we have it!</p> <p>Because this function deletes the object you're cutting, you might want to first duplicate it using the option in the object browser, then perform the cut.</p>

Video	Transcript
<p>prusaslicer_creatingaprintfile.mp4</p>	<p>To make a 3D Print we first have to slice our 3D model into instructions called GCODE, which our printer can read.</p> <p>The Gcode is essentially a set of coordinates telling it where to move the nozzle, how much plastic to push out, and what temperatures to do so.</p> <p>To slice your model into gcode in PrusaSlicer, click the add icon and open your 3D model</p> <p>We can change the size of the model in the object manipulation panel.</p> <p>Z is the vertical axis. Let's change its size to 100mm (so that our model is 10cm in height).</p> <p>For a character like this it's also a good idea to tilt the model backwards so most support ends up behind the model. To do this change the rotation on the X axis to -45</p> <p>The print settings change a lot of settings in the background but the main one is the layer height (which is that number in the title).</p> <p>The smaller the layer height, the longer the print and usually the less visible the layer lines.</p> <p>We're going to use 0.2 as it's a good balance between print time and surface finish.</p> <p>The printers we have in the Fabrication Lab at The Edge are Prusa MK3S, so let's pick that.</p> <p>We want supports everywhere, so nothing is left hanging. Infill of 15% is good for this model,</p> <p>And we will turn the brim on, which will help ensure the model sticks to the bed.</p> <p>Once that's done we can hit Slice Now, and generate our GCODE.</p> <p>It will give us this preview. It's a good idea to scroll through the layers and check that no parts of the model are starting over nothing, that there is a large surface touching the bed, and that the orange part looks like our model should.</p> <p>Once you are happy, hit export Gcode. These are the instructions we will load onto our machine.</p> <p>It's also a good idea to save the project, in case we want to come back and change some settings if our print fails.</p> <p>We're using an abbreviated view here, based on the settings that work best for most people most of the time, but slicer settings go deep! There's a lot more info about this printer and slicer on prusa3d.com.</p>

Slide	Notes
<p>Resizing your model</p> <ul style="list-style-type: none"> • Select model • Edit> Transform > set Size Z (height) to 100mm • Accept • View > Recentre View 	
<p>Making a base</p> <ul style="list-style-type: none"> • Meshmix > primitives > cylinder > drag onto background • Resize and move into place • Copy figure model using objects browser • Make one figure invisible • Select base then body and Boolean Difference 	<p>Sometimes you might want to cut one object out of another, for example to make a simple base stand for a model.</p> <p>Here we have our model, and her feet are placed just a little way into this cylinder. It's easiest to see when the cylinder is in x-ray view.</p> <p>I want to cut the feet shape out of the cylinder, so I've placed them overlapping each other.</p> <p>To make the cut first select the object you want to cut from, then hold shift and click the object you want to cut out of that first shape.</p> <p>Then select Boolean difference, and hit accept.</p> <p>And there we have it!</p> <p>Because this function deletes the object you're cutting, you might want to first duplicate it using the option in the object browser, then perform the cut.</p>
<p>Laying objects on ground</p> <ul style="list-style-type: none"> • Using transform • Can also use edit > plane cut to ensure it's flat 	
<p>From Model to 3D Printer</p> 	<p>Slicer software takes 3d model Cuts it up into thin layers like hundreds of cross sections Then draws out the picture of each cross section in lines These lines get turned into coordinates that the printer moves to and squeezes out plastic between. Prints layer by layer, from bottom to top, each layer is like a big linework picture, stacked on top of the previous So the printer doesn't "know" what it's printing. It just has a list of numbers, essentially. Builds upon itself. Can't start mid air</p>
<p>Slicing tips</p> <ul style="list-style-type: none"> • Smaller Layer height=higher quality 0.2 happy median • Infill holds up top surfaces 15% non functional parts • Slower=better quality 	<p>Smaller Layer height=higher quality due to less visible lines, more opportunity for detail, but makes print take a lot longer. 0.2mm is a happy median</p> <p>Infill holds up top surfaces. 15% is a good amount for non functional parts</p> <p>Slower=better quality because there's less inertia at sharp angles and so less wobbling.</p>

Slide	Notes
<p>PrusaSlicer</p> <ul style="list-style-type: none"> • Set Size on Z to 100mm • Tilt model -45 on X axis • Settings as per image →  	<p>To make a 3D Print we first have to slice our 3D model into instructions called GCODE, which our printer can read. The Gcode is essentially a set of coordinates telling it where to move the nozzle, how much plastic to push out, and what temperatures to do so.</p> <p>To slice your model into gcode in PrusaSlicer, click the add icon and open your 3D model. We can change the size of the model in the object manipulation panel. Z is the vertical axis. Let's change its size to 100mm (so that our model is 10cm in height). For a character like this it's also a good idea to tilt the model backwards so most support ends up behind the model. To do this change the rotation on the X axis to -45</p> <p>The print settings change a lot of settings in the background but the main one is the layer height (which is that number in the title). The smaller the layer height, the longer the print and usually the less visible the layer lines. We're going to use 0.2 as it's a good balance between print time and surface finish. The printers we have in the Fabrication Lab at The Edge are Prusa MK3S, so let's pick that. We want supports everywhere, so nothing is left hanging. Infill of 15% is good for this model, And we will turn the brim on, which will help ensure the model sticks to the bed.</p> <p>Once that's done we can hit Slice Now, and generate our GCODE. It will give us this preview. It's a good idea to scroll through the layers and check that no parts of the model are starting over nothing, that there is a large surface touching the bed, and that the orange part looks like our model should. Once you are happy, hit export Gcode. These are the instructions we will load onto our machine. It's also a good idea to save the project, in case we want to come back and change some settings if our print fails.</p> <p>We're using an abbreviated view here, based on the settings that work best for most people most of the time, but slicer settings go deep! There's a lot more info about this printer and slicer on prusa3d.com.</p>
<p>Checking Slice</p> <ul style="list-style-type: none"> • Nothing built over nothing • Lots of surface area touching the bed • Orange model looks like your model, no weird bits • Support not fully enclosing something/can be removed 	
<p>Exporting G-Code and Saving Project</p> <ul style="list-style-type: none"> • Export G-Code (file for printer) • File > Save Project (save this for editing later) 	
<p>Where to upload files to print</p> <p>Upload your Meshmixer file and your G-Code to:</p> <p>https://drive.google.com/drive/folders/1pGOaluuPEHxHWbY1Ct2bj0JlvK50F9LP?usp=sharing</p>	<p>https://drive.google.com/drive/folders/1pGOaluuPEHxHWbY1Ct2bj0JlvK50F9LP?usp=sharing</p>

<p>inkscape_colourandstyle2.mp4</p>	<p>To change the colour of a selected object we can click on a pre determined colour from this palette at the bottom of the screen</p> <p>but if we want to choose a colour that isn't listed here, we need to open the fill and stroke tool from the object menu.</p> <p>The fill is the main colour of the shape. To change it click on the flat colour icon, and change the colour mode to Wheel. from here we can change the colour by clicking and dragging the little bar on the rainbow ring, and the circle within the triangle. We can also make the colour transparent using this alpha bar.</p> <p>If we want to give our object a gradient, we can do so using the linear gradient icon. We can also edit the gradient by clicking on this icon. From here we can change a colour in our gradient by clicking on the point and changing it using the wheel or a swatch. We can add more colours to our gradient by double clicking anywhere on the gradient line and editing that dot lie we did the beginning and end dots. We can also change the direction of the gradient by clicking and dragging these points at the end of the line When we are happy with our gradient click off our object to set it.</p> <p>We can add borders to our objects. These are called Strokes. To add one, select your object Then head to the Stroke Paint menu and click the Flat colour icon. You can pick a colour for it here.</p> <p>You can change various aspects of the line in the stroke style menu, like the width... dashes.... and corner type.</p> <p>This allows you to really make objects look and feel your own.</p>

Video	Transcript
<p>inkscape_custom_shapes2.mp4</p>	<p>Sometimes you want a graphic you can't find, and thankfully Inkscape offers a few ways to make your own.</p> <p>The simplest way is by using multiple primitive shapes to create more complex new ones, which you can do via various options listed under the Path menu</p> <p>You can combine shapes using union You can cut one shape from the another by selecting the one you want to keep, then shift-clicking the one you want to remove and using difference You can keep just the area that two shapes overlap using intersection Or just the bits they don't overlap using exclusion You can also use one shape to cut parts of another shape So you can more or recolour segments of it using division.</p> <p>You can combine these methods to build up some pretty complex forms, but if you want even more flexibility it's time to look at Bezier curves.</p> <p>With this tool you can draw straight lines by left clicking to form your first point, then clicking again to form your first line, and again to form another, connected line. You can also make curves by clicking and dragging a new point, then releasing your mouse when you like the curve. And you can close a shape by clicking the first point once more.</p> <p>You can also edit your shape using the node edit tool. We can now click on these points and move their handles. You'll notice we can now move one handle to be long and one short, which allows us to further refine our shapes. But say we have a curve here but we want a corner. We can change it using this button. I can now drag this handle to make a corner. Similarly we can convert corners to straights again using this option, or to equal straight using this one.</p> <p>If you have a hand drawn picture you can scan that in and import it, then trace over it with a Bezier curve to make your graphic. That can be a good way to get a feel for things when you're just starting out wit Bezier curves.</p>

 <p>DIY ACTION FIGURES Session 4: Post-Processing & Packaging</p>	
<p>Acknowledgement of Country</p> <p>I would like to respectfully acknowledge all the traditional owners of the land on which the State Library of Queensland is situated, and those of each of the areas of land from which we are joining these sessions, virtually.</p> <p>I would like to recognise their continuing connection to land, water, and community, and pay my respects to their elders; past, present and emerging.</p>	
<p>Post-processing your prints</p> <ul style="list-style-type: none"> • Removing support • Sanding • Filing, Priming & Painting 	<p>Removing support - peel off by hand, scalpel handy at times. Sanding -by hand, wet, with mask, machine sanding will melt the plastic. Mini files are handy! Filing -Spray automotive filler great (Acrylic) Priming & Painting (Acrylic). Painting minis goes deep, lots of tutorials on YouTube!</p>
<p>What is your previous experience with graphic or visual design?</p>	
<p>Colour palette</p> <ul style="list-style-type: none"> • 4 or fewer colours • Include dark and light • Avoid "pure" colours • Help/Inspiration: <ul style="list-style-type: none"> • Coolers.co • Colour.adobe.com 	<p>More colours = more complex, more mess. 4 or fewer Include dark and light (for readability) Avoid "pure" colours (or have only one) Help: Coolers.co (randomised, and browsable) Colour.adobe.com (different methods of colour palette making)</p>

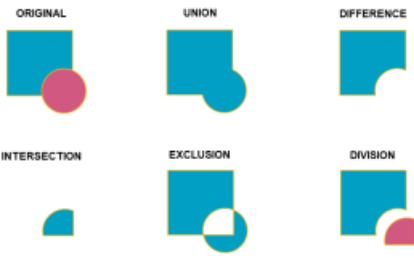

Slide	Notes
<p>Legible text</p> 	<p>Keep text a lot darker or lighter than background Pick a legible font Don't make fonts too small, remember to think about your object in the size of the real world</p>
<p>Similar theme in graphics</p> <p>Lots of different styles look chaotic and disjointed</p> 	<p>If you are going to use graphics in your images, ensure you are using ones that have the right copyright And try to keep them the same overall theme. If you are using things without lines, and some with, and some real images and some icons, the whole amalgamation can look garish.</p>
 <p>The Grid System</p> <p>How to set it up Basically you divide your page into a grid and put all your content into these, and it's a really easy way to ensure your content looks good.</p> <p>How to use it You can overflow the grids a bit, as long as you stick to the basic grids, as the borders for your content.</p>	
 <p>The Grid System</p> <p>How to set it up Basically you divide your page into a grid and put all your content into these, and it's a really easy way to ensure your content looks neat and comfy.</p> <p>How to use it You can overflow the grids a bit, as long as you stick to the basic grids, as the borders for your content.</p>	
<p>Visual Hierarchy</p> <p>Highest contrast with surroundings = seen first</p> <ul style="list-style-type: none"> • Methods: <ul style="list-style-type: none"> • Big • Drastic difference in value (light/dark) • Break in a pattern • Top to Bottom, Left to Right 	

Slide	Notes
<p>Breathing Room</p> <p>The more objects you add (text/images/graphics), the more space they need around them, else they look cluttered.</p> 	<p>This example is borderline, even though each cube has almost a full cube space between it and the next it's still quite cluttered.</p>
<p>Breathing Room</p> 	<p>These tool heads are a bit better as an example. They stand out more because they as a cluster have a lot of space around them, and there is enough space between them for them to stand alone as individuals too. It's clean and comfortable.</p>

Slide	Notes
<p>How to be creative</p> <p><i>Creativity is not about coming up with totally new ideas from nothing.</i></p> <p><i>It's about mashing knowledge together to form something new.</i></p> <p><i>Research & gather inspiration!</i></p> 	<p>Creativity isn't about coming up with totally new ideas. Creativity is about mashing bits of knowledge together to form something new.</p> <p>When we experience something new, the knowledge is fed a few times between short and long term memory while our brains work out where to index new knowledge so it can store it somewhere to use later.</p> <p>As travels this path, it actually literally scrambles through our existing memories, through the rest of our knowledge it bumps into other ideas, and it's these intersections of ideas where creativity happens.</p> <p>If you're into 3D printing you might find inspiration in woodworking, as an example, because they both have grain lines, so your brain might try to relate them to each other, and then you might find that some of the knowledge you have from woodworking applies to 3D printing, like for example that the strength of a object produced by a 3D printer is determined by the direction of the grain line. And thinking on that more you might start to see other opportunities, like that you could use traditional no-nail wood joints to join 3D printed parts without glue. And as you dwell there on the overlap between ideas you will find more and more. A woodworking sanding bow can be used to easily sand 3D prints, I wonder if I could 3D Print a woodworking bow?</p> <p>So it's this iterative process of getting a new idea and mooshing it together with existing knowledge. These intersections of concepts and the ideas therein are where the 'magic' of creativity happens.</p> <p>And knowing this is great, because it means that we can influence our own creativity. It's not some divine, ethereal power some people are blessed with and others not. The more information you're gathering and the less familiar that information is, the more your brain scrambles thoughts, and the more likely you are to come up with a creative idea.</p> <p>So, when you're making a new packaging design, you don't need to start with nothing, take a look at packages of brands you already like, find colours you like from a favourite pillow at home, find little decorative elements that aren't even from print, like all the beautiful wood cuts we have on traditional Queenslander-style houses, as an example.</p> <p>And feel free to google! I also really like sites like Pinterest, that allow me to collect images under headings. My 3D printing board is filled with embroidery, fish scales, art nouveau jewelry, book binding jigs, sanding bows, old alleyways, military medals, polly pockets, images of cracked surfaces... All kinds of things, all that inspire my 3D printed works and almost none of them that are actually 3D printed.</p> <p>Find things you like, a moosh them together. □</p> <p>You feed more in, you get more out.</p>
